Abstract

The numerous distinct subsurface databases used to construct the Relative Earthquake Hazard Maps of the Portland Metropolitan area have been brought together into a single database. The data has been made as uniform as the source database content allowed. The database is accompanied by a program which allows the data to be viewed, plotted, and printed. The data can also be edited and data added for additional projects.

Overview

This program is designed to provide a convenient way to access the subsurface data that was compiled for the Portland Metropolitan Area Relative Earthquake Hazard Mapping Project. Most all of the features of the program include context sensitive help. The following overview is a description of the database itself which this program accesses.

The first plans for earthquake hazard maps of the Portland, Oregon area were made in the late 1980's as part of the National Earthquake Hazard Reduction Program (NEHRP). As a first step in these plans the Oregon Department of Geology and Mineral Industries examined data from geotechnical investigations found in government and consultant's files and entered summary data into a dBase III+ database constructed by DOGAMI staff for this specific purpose. The contents of this database were based on data needs expressed by staff of the U.S. Geological Survey that were planning on constructing an earthquake hazard map. This data was the basis of DOGAMI publication OF-90-2 Earthquake hazard geology maps of the Portland metro area (Madin, 1990). These maps depicted Quaternary surficial geology, structure contours, isopach contours, and subsurface data point locations. There were plates for 8 different 7.5 minute topographic quadrangle maps covering the majority of the metropolitan area. The descriptive report which accompanied the plates included general explanations of how the different geologic units and their thickness might influence the effects of an earthquake. Floppy diskettes containing the database, broken down by quadrangle, were also made available. After the USGS abandoned plans for interpretive earthquake hazard maps DOGAMI applied for and was awarded a NEHRP Grant to complete a pilot hazard map of the Portland, Oregon 7.5 minute topographic quadrangle (Mabey and Madin, 1993,Mabey, Madin, Drescher, Uba, and Bosworth, 1993, Mabey, Madin, Youd, and Jones, 1993). This map sheet was chosen because it covers the core downtown area of Portland. The previously collected subsurface data was supplemented with a number of geotechnical wells completed and logged for shear wave velocity. The results of this shear wave velocity data gathering were published as Shear wave velocity measurements in the Willamette Valley and the Portland Basin, Oregon (Mabey and Madin, 1992). Following the release of the Relative Earthquake Hazard Map, Portland, Oregon 7.5 Minute Quadrangle a grant was secured from the Federal Emergency Management Agency (FEMA) which funded 5 additional quadrangle maps in the Portland area (Mabey et al., 1996, Mabey, Madin, and Meier, 1995a, 1995b, Mabey, Madin, Meier, and Palmer, 1995a, 1995b). The subsurface data collected for these maps was published as O-95-07 Downhole and seismic cone penetrometer shear-wave velocity measurements for the Portland metropolitan area, 1993and 1994 (Mabey and Madin, 1995). The database was again made available on floppy diskette, this time as an Access database. A USGS database of water well information was also used (Gannet and Caldwell, 1998). At the same time a NEHRP grant funded maps of the Vancouver and Orchards quadrangles across the Columbia River in Washington (Mabey et al., 1994). Continued FEMA funds resulted in IMS-1 Relative Earthquake Hazard Map of the Portland Metro Region, Clackamas, Multnomah, and Washington Counties, Oregon that covered the entire Portland Metro region (Mabey et al., 1997). This map required that data again be gathered from government and consultant's files. This time detailed, rather than

summary, information was collected into an Access database. Additional shear wave data was also collected for this phase of the project.

The end product of this series of events was a 12 of separate and dissimilar dBaseIII+ and Access databases. The purpose of this database project is to bring all that data together in a single database and make it available to all interested parties.

Separate Databases included with the unified database.

Included on the CD with the unified database are copies of the databases that were combined. Note that some of the later data was first entered into a database as part of this project.

O-90-2 supporting data:

BV.dbf	The result of the original effort to collect data from existing paper files for the Beaverton Quadrangle in dBase format.
CA.dbf	The result of the original effort to collect data from existing paper files for the Camas Quadrangle in dBase format.
CB.dbf	The result of the original effort to collect data from existing paper files for the Canby Quadrangle in dBase format.
DA.dbf	The result of the original effort to collect data from existing paper files for the Damascus Quadrangle in dBase format.
GS.dbf	The result of the original effort to collect data from existing paper files for the Gladstone Quadrangle in dBase format.
HB.dbf	The result of the original effort to collect data from existing paper files for the Hillsboro Quadrangle in dBase format.
LT.dbf	The result of the original effort to collect data from existing paper files for the Linnton Quadrangle in dBase format.
LO.dbf	The result of the original effort to collect data from existing paper files for the Lake Oswego Quadrangle in dBase format.
MT.dbf	The result of the original effort to collect data from existing paper files for the Mount Tabor Quadrangle in dBase format.
PT.dbf	The result of the original effort to collect data from existing paper files for the Portland Quadrangle in dBase format.
SC.dbf	The result of the original effort to collect data from existing paper files for the Scholls Ferry Quadrangle in dBase format.
SH.dbf	The result of the original effort to collect data from existing paper files for the Sherwood Quadrangle in dBase format.
O-90-2.mdb	The result of the original effort to collect data from existing paper files for all the above quadrangles in Access format.

USGS data:

WWtops2.dbf The USGS database of water well data in dBase format.
WWtops2.mdb The USGS database of water well data in Access format.

Open File O-95-7 database:

O-95-7.mdb The database of drilling done for the early phases of the Portland
Relative Earthquake Hazard Mapping project in Access format.

Part of the Open File O-90-2 database and all of the Open File O-95-7 database were released for distribution. The documentation that accompanied O-95-7 is listed below.

O-95-7.doc brief explanation of the data file in Microsoft Word format
O-95-7.txt brief explanation of the data file in plain text format

File—Open Database

This menu choice brings up a standard dialog box where the database file to be worked with can be selected. This program currently works only with Microsoft Access format databases. These databases conventionally have a ‘mdb’ suffix.

When the file has been opened the Borehole Data Record Display is automatically opened.

File—Close Database

This menu choice causes any open database to be closed and all the display windows are closed with it.

File—Sort By

This menu choice allows the user to select which field in the main database table is used to sort the data.

File—Exit

This menu choice exits the program. All databases and Display windows will be closed at the same time.

Action—Print Borehole Record

This menu choice causes a (nominally) one page textual print out of the data for the currently selected borehole. Due to space limitations, CPT data may be thinned to fit on the page. This is only true for very deep CPT profile.

Action—Print Borehole Log

This menu choice causes a (nominally) one page graphical print out of most of the data for the currently selected borehole.

Action—Add CPT Data File

This menu choice brings up a standard dialog box for choosing a file of CPT data to be read in and loaded into the database for the currently selected borehole. This is for convenience in not have to type in all the numbers resulting from a CPT. The file must be an ASCII file in the following format:

General Information Header Line

Column Heading Line
(Depth) (Qc) (Friction) (PWP)
#####, ####, ####, ####

•

####, ####, ####, ####

The first number is depth, the second Vs, the third Vp. There is no end of data designation, the End-Of-File serves this purpose, therefore no blank lines should follow the last line of data.

The following is an example:

0209/17/96 08:29 BROWN

BJHS-1

0.05	1.08	0.1226	-0.02
0.1	19.16	0.202	-0.09
0.15	28.96	0.2802	-1.57
0.2	33.25	0.2509	-1.14
0.25	36.94	0.2734	-0.9
0.3	47.91	0.3488	-0.73
0.35	49.37	0.4965	-0.6
0.4	40.92	0.44	-0.15
0.45	36.92	0.4612	-0.06
0.5	41.34	0.4854	-0.19
0.55	42.49	0.4867	-0.2
0.6	39.86	0.4054	-0.13

(etc...)

Comma separated and space separated numeric values work equally well. The file must be in this format, converted to this format or else the numbers must be tediously typed in manually.

Action—Add Velocity Data File

This menu choice brings up a standard dialog box for choosing a file of Velocity data to be read in and loaded into the database for the currently selected borehole. This is for convenience in not have to type in all the numbers resulting from a Velocity investigation. The file must be an ASCII file in the following format:

General Information Header Line

Column Heading Line such as:(Depth), (Vs), (Vp)

#####, ####, ####

•

•

• *WWWWWW* *WWWWWW* *WWWWWW*

The first number is depth, the second Vs, the third Vp. There is no end of data designation, the End-Of-File serves this purpose, therefore no blank lines should follow the last line of data.

The following is an example:

```
J:\DH\test.txt, 03-01-2000, 11:42:21
Depth(m),      Vs(m/sec),      Vp(m/sec)
0 , 250 , 1500
2 , 250 , 1500
4 , 250 , 1500
6 , 250 , 1500
8 , 250 , 1500
10 , 250 , 1500
12 , 250 , 1500
14 , 250 , 1500
16 , 250 , 1500
18 , 250 , 1500
20 , 250 , 1500
22 , 250 , 1500
24 , 250 , 1500
26 , 250 , 1500
28 , 250 , 1500
```

Comma separated and space separated numeric values work equally well. The file must be in this format, converted to this format or else the numbers must be tediously typed in manually.

File—Refresh Records

This menu choice forces the links of the various displays to the database to be refreshed so as to show recent changes made by editing the data.

Edit—Enable Editing Boreholes

This menu choice is a toggle. If unchecked, selecting it will cause it to be checked and enable the changing of the borehole database. If editing is checked, selecting it will cause it to be unchecked and disable the changing of the borehole database. The default condition is to have editing disabled.

BE CAREFUL, THERE IS NO “UNDO”. Once deleted a borehole will be gone from the database file and can only be restored by reentering the data. While the CD contains a read-only backup of the original database for you to fall back to, any data you've added must be restored from some other source of your own.

Edit—Enable Adding Borehole

This menu choice is a toggle. If unchecked, selecting it will cause it to be checked and enable the adding of new boreholes to the database. If adding is checked, selecting it will cause it to be unchecked and disable the adding of new boreholes to the database. The

default condition is to have adding disabled. This choice is only available if editing has already been enabled and will be turned off if editing is disabled.

When editing is enabled the Borehole Data Record Display tables for Lithology, SPT, CPT, and Velocity data change to a slightly different format. This format is less easy to read but allows for unambiguous editing of the data.

Editing, when enabled can be accomplished in either the Borehole Data Record Display or the Add Borehole Display (and its sub-windows for Lithology, SPT, Water Level, and Confidential data). It is simply a matter of typing in the new data information in the appropriate display field.

Edit—Enable Delete Borehole

This menu choice is a toggle. If unchecked, selecting it will cause it to be checked and enable the deleting of entire boreholes from the database. If deleting is checked, selecting it will cause it to be unchecked and disable the deleting of entire boreholes from the database. The default condition is to have deleting disabled. This choice is only available if editing has already been enabled and will be turned off if editing is disabled.

Perversely, Deleting is accomplished in the “Add Borehole Display” so as to not make it too easy.

BE CAREFUL, THERE IS NO “UNDO”. Once deleted a borehole will be gone from the database file and can only be restored by reentering the data. While the CD contains a read-only backup of the original database for you to fall back to, any data you’ve added must be restored from some other source of your own.

Window—Display Borehole Data Record

This menu choice causes the Borehole Data Record Display Window to be shown. If the window is already loaded it will be brought to the foreground. While this window is loaded by default when a database is loaded it can be closed and reopened freely, whenever it is convenient, without affecting the database.

Window—Display Borehole Log

This menu choice causes the Borehole Log Display Window to be shown. If the window is already loaded it will be brought to the foreground. While this window is not loaded by default when a database is loaded it can be opened or closed freely, whenever it is convenient, without affecting the database. The view log button will display a file, if listed in the data base, which contains some sort of subsurface log information such as a scanned paper log. Several of the records in the data set distributed with this program include such files.

Window—Display Add Borehole Form

This menu choice causes the Add Borehole Display Window to be shown. If the window is already loaded it will be brought to the foreground. While this window is not loaded

by default when a database is loaded it can be opened or closed freely, whenever it is convenient, without affecting the database.

This option is only available when editing is enabled and will be closed whenever editing is disabled. The ‘Add’ and ‘Delete’ will only be available if the corresponding feature is enabled.

Help—Help System

Some items have “context sensitive” help meaning that pressing “F1” when the item is selected will bring up the Help topic. Others, such as the plots, have “What’s this” style help such that pressing the right mouse button over the object brings up a display of the help topic.

Since the standard Windows Help System is used you can browse the Contents of the Help File, choose from the index of the Help File, or search for terms.

Help—About the Database

Help—About

This menu item merely displays a dialog box that briefly describes the program.

Borehole Record Display—Overview

Borehole Record Display—Lithology Data Table

This is a tabular display of the lithologic data for the currently selected borehole. The data is sorted by depth. When editing is disabled (the default) adjacent entries, in a given column, that have the same value are grouped together. When editing is enabled all fields of all records are displayed to allow unambiguous editing.

The Formations (Units) and Lithotypes are drawn from separate tables in the database that can only be edited outside this program.

See also: Enable Editing

Borehole Record Display—SPT Data Table

This is a tabular display of the SPT data for the currently selected borehole. The data is sorted by depth. When editing is disabled (the default) adjacent entries, in a given column, that have the same value are grouped together. When editing is enabled all fields of all records are displayed to allow unambiguous editing.

See also: Enable Editing

Borehole Record Display—CPT Data Table

This is a tabular display of the CPT data for the currently selected borehole. The data is sorted by depth. When editing is disabled (the default) adjacent entries, in a given column, that have the same value are grouped together. When editing is enabled all fields of all records are displayed to allow unambiguous editing.

See also: Enable Editing

Borehole Record Display—Velocity Data Table

This is a tabular display of the Velocity data for the currently selected borehole. The data is sorted by depth. When editing is disabled (the default) adjacent entries, in a given column, that have the same value are grouped together. When editing is enabled all fields of all records are displayed to allow unambiguous editing.

See also: Enable Editing

Borehole Record Display/Borehole Log Display—Borehole Record Selector

This object allows sequential navigation through the boreholes in the database. The double arrow to the left button returns to the first borehole in the database. The single arrow to the left moves to the preceding borehole. The text field displays the name of the currently loaded database file. The single right arrow advances to the next borehole in the database. The double right arrow advances to the last borehole in the database.

Borehole Record Display/Borehole Log Display—Find Button

This button launches a dialog box that allows a borehole to be located by its Borehole Name. The dialog box asks for the borehole name and then pressing “OK” will cause the currently displayed borehole to become the borehole corresponding to the name typed. The name must be type exactly.

Borehole Record Display—Borehole Number

The is a unique identifier for the borehole assigned by the database.

Borehole Record Display/Borehole Log Display—Borehole Name

This is an alphanumeric name the user assigns to the borehole

Borehole Record Display/Borehole Log Display—UTM X

This is the East-West coordinate for the location of the borehole in the Universal Transverse Mercator system. In this system the values are always positive and “East”. The standard units of meters are used here.

Borehole Record Display/Borehole Log Display—UTM Y

This is the North-South coordinate for the location of the borehole in the Universal Transverse Mercator system. In this system the values are always positive and “North” The standard units of meters are used here.

Borehole Record Display—Latitude

This is the North-South coordinate for the location of the borehole in the Latitude-Longitude Geographic Coordinate System. In this system positive values are North of the equator and negative values are to the South. Decimal Degrees are used here.

Borehole Record Display—Longitude

This is the East-West coordinate for the location of the borehole in the Latitude-Longitude Geographic Coordinate System. In this system positive values are East of the Greenwich Meridian and negative values are to the West. Decimal Degrees are used here.

Borehole Record Display/Borehole Log Display—Location

This is a brief alphanumeric description of the location of the borehole, such as a street address

Borehole Record Display/Borehole Log Display—Description

This is a description of the borehole that can be on any length and on any topic. It could be regarding drilling problems, the drill rig used, how to find the location, what the purpose was etc.

Borehole Record Display—Source/Project

This field is used to indicate the original source database for the included database. In general a project name for the borehole could be included here.

Borehole Record Display—Topographic Quadrangle

This field is the name of the map sheet on which the borehole can be located. The included database refers to the standard USGS 7.5 minute quadrangle maps.

Borehole Record Display—Water Level

This field shows water levels measured in the borehole. Since the value can change with time there may be more than one and the date of the measurement is included. Units are meters from the ground surface.

Borehole Record Display--Elevation

This field shows the surface elevation at the borehole's location. For the included database, most elevations were read off of USGS 7.5 minute quadrangle maps. Units are meters above mean sea-level.

Borehole Record Display—Total Depth

This field shows the total depth to which the borehole was reportedly advanced. Units are meters

Borehole Record Display—Hammer Energy

This is the reported, estimated, or measured Hammer Energy for the SPT values. Values are a percentage of the total energy available from the standard 140 lbs. dropped 30 inches.

Borehole Record Display—Hammer Type

This is actual type of hammer used to advance the SPT.

Borehole Record Display—Profile Type

This is the type/purpose of the hole. This refers to a table of Profile Types that can be edited outside this program. The 10 standard types are: Geotechnical Borehole, Geotechnical Borehole with Velocity, CPT, CPT with Velocity, Water well, DOGAMI Borehole with velocity, Test Pit, Anode/Cathode, Hand Auger, and Unknown.

Borehole Record Display—Date Drilled

This is the date which the borehole is reported to be “drilled.” Ideally this would be the completion date.

Borehole Record Display—Date Velocity Logged

This is the date that the seismic velocities of the materials penetrated by the borehole were measured.

Borehole Log Display—Plots

The Borehole hole logs display consists of several plot, as well as some simple data values to identify the borehole. Details can be found under the topics listed below

Borehole Name

UTM X

UTM Y

Location

Description

Velocity Plot

SPT Plot

CPT Tip Resistance Plot

CPT Friction Ration Plot

Unit Plot

Lithologic Column Plot

Borehole Log Display—Velocity Plot

This is a graphical plot of the Velocity. Vs is in solid Red, Vp is dashed blue.

Borehole Log Display—SPT Plot

This is a graphical plot of the SPT N values (raw blow count for last 12 inches).

Borehole Log Display—CPT Tip Resistance Plot

This is a graphical plot of the cone tip resistance.

Borehole Log Display—CPT Friction Ratio Plot

This is a graphical plot of the ratio of the friction sleeve value to the tip resistance expressed as a percentage.

Borehole Log Display—Lithology Descriptions

This is a sequential list of the descriptions of the major lithologic units.

Borehole Log Display—Unit Plot

This is a plot to scale of the Formation assignments for the lithologies in the borehole.

Borehole Log Display—Lithologic Column

This is a graphical plot of the lithologic types in the borehole.

Borehole Log Display—Update Graphics Button

This button causes the graphical display to be redrawn/refreshed.

Borehole Log Display—View Log Image Button

This button attempts to invoke a viewer for an image file, if one is listed in the database. This depends on a program being associated with the file type listed in the database to function. For example “testfile.pdf” would likely be associated with Adobe’s Acrobat Reader and “testimage.jpg” might be associated with your web browser.

Borehole Data Entry Form—Overview

This form is for adding, changing and deleting boreholes. Additional data for a given borehole can be added or changed by choosing the Lithology, SPT, Water Level, and Confidential Buttons.

If this form is displayed, editing is enabled. Any changes you make to the displayed fields will cause changes to the database.

BE CAREFUL, THERE IS NO “UNDO”. Once deleted a borehole will be gone from the database file and can only be restored by reentering the data. While the CD contains a read-only backup of the original database for you to fall back to, any data you’ve added must be restored from some other source of your own.

Borehole Data Entry Form —Find Button

This button launches a dialog box that allows a borehole to be located by its Borehole Name. The dialog box asks for the borehole name and then pressing “OK” will cause the currently displayed borehole to become the borehole corresponding to the name typed. The name must be typed exactly.

Data Entry Forms—Add Button

This button causes a new borehole, lithology, SPT, water level, or confidential (depending on which form you are in) record to be created and blank or default values are displayed in the various fields.

Data Entry Forms—Delete Button

This button causes the current borehole, lithology, SPT, water level, or confidential (depending on which form you are in) record to be deleted. A second chance warning/confirmation dialog will appear first.

BE CAREFUL, THERE IS NO “UNDO”. Once deleted a borehole will be gone from the database file and can only be restored by reentering the data. While the CD contains a

read-only backup of the original database for you to fall back to, any data you've added must be restored from some other source of your own.

Data Entry Forms—Cancel Button

This button causes the creation of a new borehole, lithology, SPT, water level, or confidential (depending on which form you are in) record to be abandon. This should not be confused with an Undo feature.

Data Entry Forms—Update Button

This button causes the creation of a new borehole, lithology, SPT, water level, or confidential (depending on which form you are in) record to be completed and committed without moving to a different borehole.

Borehole Data Entry Form —Lithology Button

The button invokes an additional form for adding lithology information that will be associated with the current borehole.

Borehole Data Entry Form —SPT Button

The button invokes an additional form for adding SPT information that will be associated with the current borehole.

Borehole Data Entry Form —Water Level Button

The button invokes an additional form for adding water level information that will be associated with the current borehole.

Borehole Data Entry Form —Confidential Button

The button invokes an additional form for adding Confidential information that will be associated with the current borehole. All confidential information for the boreholes in the included database were deleted for this distribution. Confidential information can be added for any new or existing borehole. This form is currently the only way to view the confidential information within this program.

Borehole Data Entry Form—CPT Button

The button invokes an additional form for adding CPT tip resistance and friction data that will be associated with the current borehole. The data is added one entry at a time. If the data is already in the form of an electronic file, the Action—Add CPT Data File menu item can be used.

Borehole Data Entry Form—Velocity Button

The button invokes an additional form for adding Velocity data that will be associated with the current borehole. The data is added one entry at a time. If the data is already in the form of an electronic file, the Action—Add Velocity Data File menu item can be used.
